

CAMPUS PLACEMENT PORTFOLIO STRATEGY

Final Analytics Project Suite

Three high-signal projects built for fresher Data Analyst and Product Analyst resumes targeting Meesho, Zepto, Myntra, Eternal/Zomato, Blinkit-style quick commerce, and ZS Decision Analytics.

SQL

Excel

Power BI

Python

pandas

numpy

matplotlib

EDA

Product Metrics

Decision Memos

One portfolio, two resume framings: use the same three projects, but change order and bullet wording for Data Analyst versus Product Analyst applications.

Project	Type	Best For	Score
QuickCommerceOps Inventory, Stockout and SKU Performance Analytics	Full DA	Zepto, Blinkit/Eternal, Meesho ops, ZS analytics	94/100
MarketPulse E-commerce Customer, Revenue and Seller Growth Analytics	Full DA	Meesho, Myntra, ZS, general DA roles	92/100
FunnelLens Product Funnel, Retention and Experiment Analytics	PA	Eternal/Zomato, Myntra, Meesho Product Analyst	91/100

The Strategy

Do not build many shallow dashboards. Build three projects deeply and make each one end with a business decision. This works especially well for fresher on-campus placements because interviewers can test SQL, Excel, Python, dashboarding, metrics thinking, and communication from the same portfolio.

Why This Mix Works

Need	Project Coverage	Interview Signal
Operations analytics	QuickCommerceOps	You can handle inventory, availability, stockouts, pricing, data quality, and KPI monitoring.
Business/customer analytics	MarketPulse	You can analyze orders, revenue, seller performance, customer retention, geography, reviews, and growth levers.
Product analytics	Funnellens	You can define metrics, diagnose funnel leakage, read cohorts, think about experiments, and recommend product action.
ZS-style decision analytics	All three	You can solve a business problem, model scenarios, summarize insights, and communicate a recommendation.

Skill Coverage

Skill	How It Appears
SQL	Cleaning, joins, CTEs, window functions, cohorts, RFM, ranking, funnel queries, KPI tables.
Excel	Pivot tables, XLOOKUP, data audit, what-if analysis, ROI model, decision memo.
Python	pandas cleaning, numpy calculations, matplotlib EDA, segmentation, forecasting, basic statistical testing.
Power BI	Executive dashboards, slicers, drilldowns, KPI cards, DAX measures, dashboard storytelling.
Business thinking	Each project ends with a recommendation: what to fix, target, stock, promote, retain, or launch.

Important: Do not put placeholder numbers on your resume. Use actual values from your final analysis. If a metric is simulated, label it as simulated inside the repo and avoid overclaiming it in resume bullets.

Resume Ordering

Data Analyst Resume Order

1. **QuickCommerceOps** - strongest DA signal for SQL, Excel, Power BI, operations KPIs, and business dashboards.
2. **MarketPulse** - strongest general business analytics signal for e-commerce, customers, sellers, revenue, and delivery.
3. **FunnelLens** - adds product analytics depth without making the resume look non-DA.

Product Analyst Resume Order

1. **FunnelLens** - strongest PA signal for metrics, funnel, retention, experimentation, and product decisions.
2. **MarketPulse** - shows customer behavior, revenue, reviews, growth, and platform thinking.
3. **QuickCommerceOps** - shows operational product/business thinking for quick-commerce platforms.

Project Section Template

Project Name | SQL, Python, Excel, Power BI | Dataset size or scope | GitHub | Dashboard

- Start each bullet with the business problem, not just the tool.
- Use one bullet for data pipeline and technical depth.
- Use one bullet for insight and recommendation.
- Use one bullet for measurable output: KPI dashboard, cohort table, segment list, forecast, or decision memo.

Best Resume Project Block - DA Version

QuickCommerceOps - Inventory, Stockout and SKU Performance Analytics | SQL, Excel, Python, Power BI

- Built a quick-commerce inventory analytics system to identify stockout-prone SKUs, discount leakage, category availability gaps, and reorder priorities.
- Cleaned and transformed SKU, category, MRP, discount, weight, and availability fields using SQL and pandas; created reusable KPI tables for Power BI reporting.
- Designed an executive Power BI dashboard with stockout rate, category health, high-value unavailable SKUs, discount distribution, and SKU drilldowns.

MarketPulse - E-commerce Customer, Revenue and Seller Growth Analytics | SQL, Python, Excel, Power BI

- Analyzed 100K+ e-commerce orders to study revenue trends, customer repeat behavior, seller performance, delivery delays, payment mix, and review-score drivers.
- Used SQL CTEs and window functions to create monthly KPI tables, seller rankings, category trends, late-delivery flags, and customer cohorts.
- Built a Power BI dashboard and Excel decision memo recommending growth levers for high-performing categories, delayed regions, and low-review segments.

FunnelLens - Product Funnel, Retention and Experiment Analytics | SQL, Python, Power BI

- Built a product analytics pipeline on 2.7M e-commerce event records to analyze view-to-cart-to-purchase funnel conversion and weekly retention cohorts.
- Created SQL funnel tables, Python EDA charts, retention heatmaps, and a Power BI product-health dashboard for activation and repeat behavior.
- Prepared a product decision memo identifying key funnel leakage points and recommending targeted activation and retention experiments.

Project 1: QuickCommerceOps

Full DA

Operations Analytics

Best for Zepto/Blinkit

Score 94/100

Full title: QuickCommerceOps: Inventory, Stockout and SKU Performance Analytics

Core idea: Build an analyst-grade system that tells a quick-commerce business which SKUs are unavailable, where discounts are leaking margin, which categories need restocking, and which products deserve priority attention.

Why This Project Is High Signal

- Zepto-style roles care about KPIs, dashboards, product manager requirements, data sanity, SQL, Excel, and visualization.
- Quick-commerce businesses are operationally intense: stockouts, availability, SKU mix, category demand, and pricing decisions matter daily.
- ZS also values decision-support analytics, and this project can be framed as a business operations case.

Dataset

- Primary: [Zepto Inventory Dataset - Kaggle](#)
- Optional extension: [Instacart Online Grocery Basket Dataset](#) for basket and reorder behavior.

Business Questions

1. Which categories have the highest out-of-stock risk?
2. Which high-MRP products are unavailable and may hurt revenue?
3. Which SKUs have heavy discounts that may reduce margin?
4. Which product categories carry most of the inventory weight or value?
5. Which SKUs should be prioritized for replenishment?
6. Which items look like poor assortment choices because they are low discount, high price, or unavailable?

SQL Work

- Create normalized table: SKU, category, name, MRP, discounted price, discount percent, weight, availability.
- Clean price units, remove zero price rows, handle nulls, standardize category names, remove duplicates.
- Use CTEs for category-level KPIs: SKU count, available count, stockout rate, average discount, estimated inventory value.
- Use window functions to rank top unavailable high-value SKUs by category.
- Create flags: high discount, high MRP, out of stock, bulk item, low discount expensive item.

Python Work

- pandas cleaning and validation: missing values, duplicates, price distribution, category outliers.
- numpy calculations for discount bands, price-per-gram, availability score, and SKU priority score.
- matplotlib charts: category stockout rate, discount distribution, price versus availability, top high-risk SKUs.
- Optional: simple demand proxy model using category, discount, price, and item weight.

Excel Work

- Data audit sheet with row counts before/after cleaning.
- Pivot table by category: stockout rate, average discount, SKU count, inventory value.
- What-if sheet for reorder priority: target availability, estimated lost sales proxy, replenishment quantity.
- One-page decision memo for operations manager.

Power BI Dashboard Pages

Page	Purpose	Visuals
Executive Overview	Show business health quickly.	KPI cards: total SKUs, stockout rate, average discount, high-risk SKUs, inventory value proxy.
Category Health	Find categories needing intervention.	Bar chart by category, stockout heatmap, discount scatter, drilldown table.
SKU Risk List	Operational action list.	Ranked SKU table with stock flag, price, discount, category, priority score.
Pricing and Discount	Understand discount leakage.	Discount bands, high-MRP low-discount items, price-per-gram analysis.

Final Output

- `sql/01_clean_inventory.sql`
- `sql/02_inventory_kpis.sql`
- `notebooks/quickcommerce_ops_eda.ipynb`
- `excel/quickcommerce_reorder_what_if.xlsx`
- `powerbi/quickcommerce_ops_dashboard.pbix`
- `memo/operations_decision_memo.pdf`

Resume Bullets

- Built a quick-commerce inventory analytics system using SQL, Python, Excel, and Power BI to identify stockout-prone SKUs, discount leakage, and category-level availability gaps across Zepto-style inventory data.**
- Created reusable SQL KPI tables and a Power BI dashboard tracking SKU availability, stockout rate, discount distribution, high-value unavailable items, and category health for operational decision-making.**
- Developed an Excel what-if model and decision memo to prioritize replenishment actions based on price, category, availability, discount, and estimated inventory value.**

Project 2: MarketPulse

Full DA

Business Analytics

Best for Meesho/Myntra/ZS

Score 92/100

Full title: MarketPulse: E-commerce Customer, Revenue and Seller Growth Analytics

Core idea: Build a full e-commerce business intelligence case study that explains what is driving revenue, which customers repeat, which sellers perform, how delivery affects reviews, and where the business should intervene.

Why This Project Is High Signal

- Meesho and Myntra both map well to marketplace analytics: customers, sellers, categories, logistics, reviews, and growth.
- ZS likes rigorous analysis, client-style recommendations, and clear communication. This project can be presented as a consulting-style business case.
- It gives you the most general DA credibility because it touches orders, payments, revenue, geography, product categories, customer behavior, and dashboards.

Dataset

- Primary: [Brazilian E-Commerce Public Dataset by Olist](#)
- Useful tables: orders, order items, customers, sellers, products, payments, reviews, geolocation.

Business Questions

1. Which categories and sellers contribute most to revenue?
2. Which customer cohorts repeat and which churn after first order?
3. Does late delivery reduce review scores?
4. Which geographies have strong demand but poor delivery/review performance?
5. Which payment methods and order values dominate revenue?
6. Which sellers should the platform support, monitor, or deprioritize?

SQL Work

- Join orders, order items, customers, sellers, payments, products, and reviews.
- Create monthly KPI tables: orders, revenue, AOV, unique customers, repeat customers, late delivery rate, average review score.
- Use window functions for seller ranking, month-over-month growth, and customer order sequence.
- Create RFM-style customer segments using recency, frequency, and monetary value.
- Flag delayed deliveries and compare review score distributions for delayed versus on-time orders.

Python Work

- pandas data cleaning, merge validation, missing value treatment, and outlier checks.
- matplotlib EDA: revenue trend, review score distribution, delivery delay distribution, category contribution.
- Correlation and group comparison: delivery delay versus review score, seller volume versus rating, payment mix versus AOV.

- Optional: simple customer segmentation with RFM score or clustering.

Excel Work

- Monthly business tracker with pivot tables and slicers.
- Seller scorecard: revenue, order count, late delivery rate, average rating, refund/cancellation proxy if available.
- What-if sheet for improving delivery performance or seller support.
- One-page business recommendation memo.

Power BI Dashboard Pages

Page	Purpose	Visuals
Business Overview	Executive performance view.	Revenue, orders, AOV, customers, repeat rate, average review score.
Customer Growth	Understand repeat behavior and customer quality.	Cohort table, RFM segments, repeat purchase funnel, geography filters.
Seller and Category	Find marketplace growth levers.	Seller leaderboard, category revenue, seller quality score, Pareto chart.
Delivery and Reviews	Connect operations to customer experience.	Late delivery rate, review score comparison, city/state performance, delay trends.

Final Output

- `sql/01_build_ecommerce_model.sql`
- `sql/02_customer_seller_kpis.sql`
- `notebooks/marketpulse_eda.ipynb`
- `excel/marketpulse_business_tracker.xlsx`
- `powerbi/marketpulse_dashboard.pbix`
- `memo/growth_decision_memo.pdf`

Resume Bullets

Developed an end-to-end e-commerce analytics project on 100K+ orders using SQL, Python, Excel, and Power BI to analyze customer repeat behavior, seller performance, delivery delays, revenue trends, and review-score drivers.

Built SQL KPI tables using joins, CTEs, date functions, and window functions to track revenue, AOV, repeat rate, seller rankings, category growth, late delivery rate, and average review score.

Created a Power BI executive dashboard and Excel decision memo identifying high-performing categories, delayed regions, weak seller segments, and customer growth opportunities.

Project 3: FunnelLens

Product Analyst Funnel Analytics Retention Score 91/100

Full title: FunnelLens: Product Funnel, Retention and Experiment Analytics

Core idea: Build a product analytics decision engine that diagnoses where users drop from view to cart to purchase, whether cohorts return, and what product intervention should be tested next.

Why This Project Is High Signal

- Product Analyst interviews often test product metrics, funnels, retention, SQL, and case thinking.
- Eternal/Zomato campus-style PA preparation strongly benefits from SQL plus product metric depth.
- Myntra and Meesho product analytics roles care about customer behavior, website/app changes, and business impact.

Dataset

- Primary: [RetailRocket E-commerce Events Dataset](#)
- Key fields: visitor ID, event type, item ID, timestamp, category tree, item properties.

Business Questions

1. What is the conversion rate from view to cart to transaction?
2. Where is the biggest funnel leakage?
3. Which cohorts return in week 1, week 2, and week 3?
4. Which user segments are most likely to purchase?
5. Which product/category behavior indicates activation?
6. What experiment should the product team run next?

SQL Work

- Clean event timestamps and reconstruct sessions using a 30-minute inactivity rule.
- Create event-level fact table and session table.
- Build funnel queries: visitors who viewed, carted, purchased, and dropped at each step.
- Build retention cohorts by first active week and return week.
- Use window functions for user event sequence and time-to-cart/time-to-purchase calculations.

Python Work

- pandas EDA for event volume, user activity distribution, session length, and repeat behavior.
- matplotlib charts for funnel conversion, retention curves, hourly/weekday usage, and purchase behavior.
- Basic statistical testing for a simulated or natural A/B-style split if no real experiment exists.
- Optional logistic regression for purchase likelihood using session count, cart frequency, recency, and category interactions.

Excel Work

- Decision memo: product problem, metric, diagnosis, recommendation, expected impact.

- Experiment rollout model: baseline conversion, expected lift, sample size notes, guardrail metric.
- Metric dictionary: activation, conversion, retention, guardrail, churn-risk proxy.

Power BI Dashboard Pages

Page	Purpose	Visuals
Product Health	Summarize current product behavior.	Active visitors, active buyers, conversion rate, cart rate, repeat rate.
Funnel	Find leakage.	View-cart-purchase funnel, drop-off bars, segment filters, category drilldown.
Retention	Understand cohort quality.	Weekly cohort heatmap, retention curve, first-week behavior, repeat users.
Experiment Scorecard	Make a ship/no-ship decision.	Variant comparison, lift, confidence interval/p-value, guardrail status, recommendation.

Final Output

- `sql/01_clean_events.sql`
- `sql/02_funnel_and_retention.sql`
- `notebooks/funnellens_product_eda.ipynb`
- `excel/funnellens_experiment_memo.xlsx`
- `powerbi/funnellens_product_dashboard.pbix`
- `memo/product_decision_memo.pdf`

Resume Bullets

Built a product analytics decision engine on 2.7M e-commerce events to analyze activation, funnel drop-off, retention cohorts, and experiment impact; translated findings into product recommendations.

Created SQL funnel and cohort models, Python EDA charts, and a Power BI product-health dashboard tracking view-to-cart-to-purchase conversion and weekly retention.

Prepared a product decision memo with activation diagnosis, guardrail metrics, and an experiment recommendation for improving conversion and repeat behavior.

Dual Resume Framing

Data Analyst Framing

Lead with the data pipeline, SQL complexity, dashboard output, and measurable business KPIs. Keep product recommendations as the final sentence.

Project	DA Framing
QuickCommerceOps	SQL inventory model, Excel what-if analysis, Python EDA, Power BI KPI dashboard, stockout and SKU prioritization.
MarketPulse	Multi-table e-commerce data model, revenue/customer/seller KPIs, cohort and review analysis, executive dashboard.
FunnelLens	Event data pipeline, SQL funnel and cohort tables, Python EDA, Power BI product behavior dashboard.

Product Analyst Framing

Lead with the product/business decision, metric, user behavior, and recommendation. Keep tooling visible but secondary.

Project	PA Framing
FunnelLens	Diagnosed funnel leakage, defined activation/retention metrics, designed experiment scorecard, recommended product intervention.
MarketPulse	Found customer, seller, and delivery levers affecting revenue, reviews, repeat behavior, and marketplace growth.
QuickCommerceOps	Prioritized stockout and availability fixes that protect user experience and quick-commerce reliability.

One-Line Pitch For Interviews

"I built three analytics projects around real business decisions: quick-commerce inventory optimization, e-commerce marketplace growth, and product funnel/retention analytics. Each project has SQL modeling, Python EDA, Excel decision support, and a Power BI dashboard, but the main focus is the recommendation."

30-Second Project Walkthrough Template

- Problem:** What business decision did the project support?
- Data:** What tables and dataset did you use?
- Method:** What SQL/Python/Excel/Power BI work did you do?

4. **Insight:** What did you find?

5. **Recommendation:** What should the business or product team do next?

Build Plan

This is a practical build plan for a fresher. If placements are close, build the minimum impressive version first, then add advanced pieces.

Week	Goal	Deliverable
Week 1	QuickCommerceOps	Clean SQL tables, 8-10 business queries, Python EDA, Power BI dashboard, Excel reorder sheet.
Week 2	MarketPulse	Olist data model, monthly KPIs, customer/seller analysis, dashboard, business memo.
Week 3	FunnelLens	RetailRocket event cleaning, funnel SQL, retention cohorts, product dashboard, experiment memo.
Week 4	Polish and interview prep	GitHub READMEs, screenshots, resume bullets, 30-second and 2-minute walkthroughs.

Minimum Bar For Each GitHub Repo

- `README.md` with problem, dataset, tools, schema, analysis flow, insights, recommendations.
- `sql/` folder with clean, commented queries.
- `notebooks/` folder with EDA and charts.
- `dashboard/` folder with Power BI file or screenshots.
- `excel/` folder with what-if model or decision tracker.
- `memo/` folder with a one-page business or product decision memo.

README Structure

1. Business problem
2. Dataset and data dictionary
3. Tools used
4. Data cleaning steps
5. SQL analysis questions
6. Python EDA summary
7. Dashboard screenshots
8. Key insights
9. Recommendations
10. What I would improve with real company data

Company Targeting Matrix

Company / Role	Best Project To Lead With	Why
Zepto Data Analyst	QuickCommerceOps	Directly maps to quick commerce, SKU availability, stockouts, dashboards, SQL, Excel, and operational KPIs.
Blinkit / Eternal ops analytics	QuickCommerceOps	Shows dark-store style thinking: product availability, SKU prioritization, and speed-sensitive operations.
Meesho Business/Data Analyst	MarketPulse	Marketplace growth, customer behavior, seller performance, logistics, and strategic planning fit Meesho strongly.
Myntra Data Analyst	MarketPulse	Fits customer growth, dashboards, SQL, Python, Excel, BI, and category/seller/product performance analysis.
Myntra Product Analyst	Funnellens	Shows digital behavior analysis, funnel metrics, retention, product recommendations, and dashboards.
Eternal/Zomato Product Analyst	Funnellens	Best match for SQL, product metrics, funnel thinking, case interviews, retention, and experiment reasoning.
ZS Decision Analytics	MarketPulse or QuickCommerceOps	Both can be framed as client decision problems with analysis, Excel modeling, dashboards, and recommendation storytelling.

What To Say If Asked "Why These Projects?"

"I wanted my portfolio to show more than dashboarding. So I built one operations analytics project, one business growth analytics project, and one product analytics project. Together they show SQL depth, Excel decision modeling, Python EDA, Power BI reporting, and the ability to convert data into recommendations."

What To Say If Asked "What Would You Improve?"

- Add real-time data refresh and automated quality checks.
- Add experiment logs and true control/variant exposure data for Funnellens.
- Add actual gross margin, cancellation, refund, and inventory replenishment cost data for better business impact estimation.

- Deploy dashboards with scheduled refresh and stakeholder-specific views.

Interview Bullet Bank

SQL Talking Points

- I used CTEs to structure multi-step KPI logic instead of writing one unreadable query.
- I used window functions for seller ranking, month-over-month growth, customer order sequence, and cohort indexing.
- I validated joins by checking row counts before and after each merge.
- I created analysis-ready tables so the Power BI layer did not contain messy transformation logic.

Python Talking Points

- I used pandas for missing value checks, duplicate handling, derived features, and merge validation.
- I used numpy for scoring logic and numerical transformations.
- I used matplotlib for EDA charts before building final dashboard visuals.
- I kept Python focused on EDA and statistical reasoning, while SQL handled repeatable KPI tables.

Excel Talking Points

- I used Excel for business-facing what-if analysis because many stakeholders still consume models in spreadsheets.
- I used pivot tables, lookup formulas, conditional formatting, and sensitivity inputs.
- I documented assumptions in Excel so the recommendation was transparent.

Power BI Talking Points

- I designed dashboards around decisions, not just charts.
- I used KPI cards for executive summary and drilldown tables for analyst action.
- I kept the first page simple: health, trend, segment, recommendation.
- I used filters for category, time, seller, geography, and segment depending on the project.

Sources Used For Project Fit

These sources were used to map project choices to target company expectations and dataset feasibility.
